

## **Exercise 9      Applet to Servlet Communication – Login Authentication**

Develop an applet-servlet communication program for Login Authentication. Applet serves as a front-end with two textfields for “Username”, “Password” and a button for “Login”. After filling out the credentials and once the “Login” button is pressed, the details should be submitted to a Servlet. The Servlet validate the information and replies to the applet with a message “Login Successful” for valid credentials or otherwise “Login Failed”.
